Lecture 32: The prediction interval formulas for the next observation from a normal distribution when σ is unknown

1. Introduction

In this lecture we will derive the formulas for the symmetric two-sided prediction interval for the $n + 1$-st observation and the upper-tailed prediction interval for the $n + 1$-st observation from a normal distribution *when the variance σ^2 is unknown*. We will need the following theorem from probability theory that gives the distribution of the statistic $\overline{X} - X_{n+1}$.

Suppose that $X_1, X_2, \ldots, X_n, X_{n+1}$ is a random sample from a normal distribution with mean μ and variance σ^2.

Theorem 1

The random variable $T = \left(\overline{X} - X_{n+1}\right) / \left(\sqrt{\dfrac{n+1}{n}} S \right)$ has t distribution with $n - 1$ degrees of freedom.

2. The two-sided prediction interval formula

Now we can prove the theorem from statistics giving the required prediction interval for the next observation xn+1 in terms of n observations $x_1, x_2, \ldots, x_n$. Note that it is symmetric around $\overline{X}$. This is one of the basic theorems that you have to learn how to prove. There are also asymmetric two-sided prediction intervals.

Theorem 2

The random interval $\left(\overline{X} - t_{\alpha/2,n-1} \sqrt{\dfrac{n+1}{n}} S, \; \overline{X} + t_{\alpha/2,n-1} \sqrt{\dfrac{n+1}{n}} S \right)$ is a $100(1 - \alpha)\%$-*prediction interval for x_{n+1}.*

Lecture 32: The prediction interval formulas for the next observation from a normal distribution when σ is unknown

Proof.

We are required to prove

$$P\left(X_{n+1} \in \left(\overline{X} - t_{\alpha/2,n-1}\sqrt{n+1}nS, \ \overline{X} + t_{\alpha/2,n-1}\sqrt{\frac{n+1}{n}}S\right)\right) = 1 - \alpha.$$

We have

$$\begin{aligned}
\text{LHS} &= P\left(\overline{X} - t_{\alpha/2,n-1}\sqrt{\frac{n+1}{n}}S < X_{n+1}, X_{n+1} < \overline{X} + t_{\alpha/2,n-1}\sqrt{\frac{n+1}{n}}S\right) \\
&= P\left(\overline{X} - X_{n+1} < t_{\alpha/2,n-1}\right) \\
&= P\left(\overline{X} - X_{n+1} < t_{\alpha/2,n-1}\sqrt{\frac{n+1}{n}}S, \overline{X} - X_{n+1} > -t_{\alpha/2,n-1}\sqrt{\frac{n+1}{n}}S\right) \\
&= P\left(\left(\overline{X} - X_{n+1}\right) / \sqrt{\frac{n+1}{n}}S < t_{\alpha/2,n-1}, (\overline{X} - X_{n+1}) / \sqrt{\frac{n+1}{n}}S > -t_{\alpha/2,n-1}\right) \\
&= P\left(T < t_{\alpha/2,n-1}, T > -t_{\alpha/2,n-1}\right) = P\left(-t_{\alpha/2,n-1} < T < t_{\alpha/2,n-1}\right) = 1 - \alpha
\end{aligned}$$

To prove the last equality draw a picture. $\qquad\square$

Lecture 32: The prediction interval formulas for the next observation from a normal distribution when σ is unknown

Once we have an actual sample $x_1, x_2, \ldots, x_n$ we obtain the the observed value $\left(\overline{x} - t_{\alpha/2,n-1} \sqrt{\dfrac{n+1}{n}} s, \overline{x} + t_{\alpha/2,n-1} \sqrt{\dfrac{n+1}{n}} s \right)$ for the prediction (random) interval $\left(\overline{X} - t_{\alpha/2,n-1} \sqrt{\dfrac{n+1}{n}} S, \overline{X} + t_{\alpha/2,n-1} \sqrt{\dfrac{n+1}{n}} S \right)$ The observed value of the prediction (random) interval is also called the two-sided $100(1 - \alpha)\%$ prediction interval for x_{n+1}.

3. The upper-tailed prediction interval

In this section we will give the formula for the upper-tailed prediction interval for the next observation x_{n+1}.

Theorem 3

The random interval $\left(\overline{X} - t_{\alpha,n-1} \sqrt{\dfrac{n+1}{n}} S, \infty \right)$ is a $100(1 - \alpha)\%$-prediction interval for the next observation x_{n+1}.

Proof

We are required to prove

$$P\left(X_{n+1} \in \left(\overline{X} - t_{\alpha,n-1} \sqrt{\dfrac{n+1}{n}} S, \infty \right) \right) = 1 - \alpha.$$

Lecture 32: The prediction interval formulas for the next observation from a normal distribution when σ is unknown

3/5

Proof (Cont.)

We have

$$
\begin{aligned}
\text{LHS} &= P\left(\overline{X} - t_{\alpha,n-1}\sqrt{\frac{n+1}{n}}S < X_{n+1}\right) \\
&= P\left(\overline{X} - X_{n+1} < t_{\alpha,n-1}\sqrt{\frac{n+1}{n}}S\right) \\
&= P\left((\overline{X} - X_{n+1})/\sqrt{\frac{n+1}{n}}S < t_{\alpha,n-1}\right) \\
&= P(T < t_{\alpha,n-1}) \\
&= 1 - \alpha
\end{aligned}
$$

To prove the last equality draw a picture - I want *you* to draw the picture on tests and the final. □

Once we have an actual sample $x_1, x_2, \ldots, x_n$ we obtain the observed value $\left(\overline{x} - t_{\alpha,n-1}\sqrt{\frac{n+1}{n}}s, \infty\right)$ of the upper-tailed prediction (random) interval $\left(\overline{X} - t_{\alpha,n-1}\sqrt{\frac{n+1}{n}}S, \infty\right)$ The observed value of the upper-tailed prediction (random) interval is also called the upper-tailed $100(1-\alpha)\%$ prediction interval for x_{n+1}.

The number random variable $\overline{X} - t_{\alpha,n-1}\sqrt{\dfrac{n+1}{n}}S$ or its observed value

$\overline{x} - t_{\alpha,n-1}\sqrt{\dfrac{n+1}{n}}s$ is often called a prediction *lower bound* for x_{n+1} because

$$P\left(\overline{X} - t_{\alpha,n-1}\sqrt{\dfrac{n+1}{n}}S < X_{n+1}\right) = 1 - \alpha.$$
